Pharmaceutical Calculations Jan 16 2022 A book in pharmaceutical calculations laden with worked examples and making it easy for even the slowest learner to grasp the concepts of mathematics in pharmaceutical practice. The author has been teaching pharmaceutical calculations at the university level for the past twenty-five years. The author also realized that students come from various backgrounds, some being good in mathematics and some lacking the proper background and hence, not as good. The manual is designed to simply provide a reference material in pharmaceutical calculations that can be used by students of all levels (dispensers, pharmaceutical assistants, and technicians as well as pharmacy degree students) regardless of their backgrounds. The manual is an asset to both students and tutors alike. It is also intended to impart ability to students to work independently and understand practical problems that occur in practice from time to time. In writing this manual, the author carefully followed various curricula of pharmacy at certificate, diploma, and degree levels of various institutions. The manual also addresses components of the curriculum of nursing courses, particularly calculations involving doses and dosages. Thus, trainers will choose topics relevant to the level they are dealing with. The manual is enriched with over 350 worked examples and about 150 practice questions with answers to make self-study possible. With many practical worked examples, even the slowest learner can be taken onboard. Furthermore, this manual will be a quick reference for practicing pharmaceutical technicians, nurses, and pharmacists.

Pharmaceutical Biotechnology Dec 23 2019 Pharmaceutical Biotechnology is a unique compilation of reviews addressing frontiers in biologicals as a rich source for innovative medicines. This book fulfills the needs of a broad community of scientists interested in biologicals from diverse perspectives—basic research, biotechnology, protein engineering, protein delivery, medicines, pharmaceuticals and vaccinology. The diverse topics range from advanced biotechnologies aimed to introduce novel, potent engineered vaccines of unprecedented efficacy and safety for a wide scope of human diseases to natural products, small peptides and polypeptides engineered for discrete prophylaxis and therapeutic purposes. Modern biologicals promise to dramatically expand the scope of preventive medicine beyond the infectious disease arena into broad applications in immune and cancer treatment, as exemplified by anti-EGFR receptors antibodies for the

treatment of breast cancer. The exponential growth in biologicals such as engineered proteins and vaccines has been boosted by unprecedented scientific breakthroughs made in the past decades culminating in an in-depth fundamental understanding of the scientific underpinnings of immune mechanisms together with knowledge of protein and peptide scaffolds that can be deliberately manipulated. This has in turn led to new strategies and processes. Deciphering the human, mammalian and numerous pathogens' genomes provides opportunities that never before have been available—identification of discrete antigens (genomes and antigensomes) that lend themselves to considerably improved antigens and monoclonal antibodies, which with more sophisticated engineered adjuvants and agonists of pattern recognition receptors present in immune cells, deliver unprecedented safety and efficacy. Technological development such as nanobiotechnologies (dendrimers, nanobodies and fullerenes), biological particles (viral-like particles and bacterial ghosts) and innovative vectors (replication-competent attenuated, replication-incompetent recombinant and defective helper-dependent vectors) fulfill a broad range of cutting-edge research, drug discovery and delivery applications. Most recent examples of breakthrough biologicals include the human papilloma virus vaccine (HPV, prevention of women genital cancer) and the multivalent Pneumococcal vaccines, which has virtually eradicated in some populations a most prevalent bacterial ear infection (i.e., otitis media). It is expected that in the years to come similar success will be obtained in the development of vaccines for diseases which still represent major threats for human health, such as AIDS, as well as for the generation of improved vaccines against diseases like pandemic flu for which vaccines are currently available. Furthermore, advances in comparative immunology and innate immunity revealed opportunities for innovative strategies for ever smaller biologicals and vaccines derived from species such as llama and sharks, which carry tremendous potential for innovative biologicals already in development stages in many pharmaceutical companies. Such recent discoveries and knowledge exploitations hold the promise for breakthrough biologicals, with the coming decade. Finally, this book caters to individuals not directly engaged in the pharmaceutical drug discovery process via a chapter outlining discovery, preclinical development, clinical development and translational medicine issues that are critical the drug development process. The authors and editors hope that this compilation of reviews will help readers rapidly and completely update knowledge and understanding of the frontiers in pharmaceutical biotechnologies.

Therefore in most of the cases the students need to use the instruments that are used in industry or otherwise mimic the conditions similar to that of industry. For every formulation and for every group of formulations general principles are written. As these practicals are for final year B.Pharm students, evaluation is also included for every formulation. Schedules are given for the formulations and accordingly labeling is to be done.
